                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes an isolated human nucleic acid (I) encoding any of 120 10-1533 residue amino acid sequences (S1), given in the specification, comprising any of 164 179-12421 base pair sequences (S2), given in the specification. The methods and compositions of the present invention are useful for identifying, diagnoshing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists so it the polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. The invention describes a new isolated polynucleotide (I) encoding a polypeptide with biological activity comprising: a nucleotide sequence of polypeptide with biological activity comprising: a nucleotide sequence of (I) under stringent hybridization conditions; or a nucleotide sequence of (I) under stringent hybridization conditions; or a nucleotide sequence of (I) under stringent hybridization conditions; or a nucleotide sequence of (I). Also described are: a(I) (expression) vector comprising (I); a host cell genetically engineered to comprise (I) operatively, associated with a regulatory sequence that modulates expression of the polymetide in the host cell; an isolated polypeptide conditions with any one of SEQ is: a polypeptide encoded by (I); or a polypeptide encoded by a sequence of SEQ ID NOS: 568-1134 ([Mully defined), where the polypeptide of (SEQ ID NOS: 1-567; a composition comprising the polypeptide of (3); a method carrier; an antibody directed against the polypeptide of (3); a method of ridentifying a compound that binds to the polypeptide of (3); a method for identifying a compound that binds to the polypeptide of (3); a method of polymucleotides, where the collection of (3); and a collection of polymucleotides, where the collection of (3); and a collection of polymucleotides, where the collection of (3); and a collection of polymucleotides, where the collection of (3); and a collection of polymucleotides, where the collection of sequences of SEQ ID NOS: 1-567. (I) is a polymucleotide comprising of a collection of polymucleotides, where the collection of activity, which comprises any of the amino acid sequences and methods are useful in diagnostics, forenic, and gene mapping, in identifying of mutations responsible for genetic disorders or composition and method are useful for treating a disease, burns, CN of partipheral disease, all parties, viral infection, or cancer. This sequence encodes a concodes a polymential of the polymential of the invention. novel polypeptide of the invention.

                                                                                                                                                                                                                                                                                          The invention describes an isolated human nucleic acid (I) encoding any of 120 10-1533 residue amino acid sequences (S1), given in the specification, comprising any of 164 179-1421 base pair sequences (S2), given in the specification. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, thousand non-cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. This sequence encodes a lung specific nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                 New isolated human nucleic acid molecule and polypeptide, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AGTGAACCCTGACTCCATCCCCTATTGCCACCTAACCAATCATGCAAACTTCTCCCTC

```
The invention relates to a novel isolated nucleic acid molecule comprising: a sequence encoding a sequence comprising 11-1518 amino acids is a sequence comprising 190-8144 bp; or a sequence that selectively hybridises to, or having at least 60% identity with the 11-1518 amino acid or 190-8144 nt sequence. The polypeptide and the nucleic acid are useful for treating breast cancer, and diagnosing or monitoring the presence of metastases of breast cancer in a patient. The polynucleotides of the invention can be used to treat disorders by gene therapy. This polynucleotide represents a breast specific related sequence of the
                                                                                                                                                                                                                                                                                         isolated nucleic acid molecule, useful for treating breast cancer, diagnosing or monitoring the presence of metastases of breast cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is one of 1351 sequences in a library of human polymucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polymucleotides on the probes can be used for chromosome mapping of the polymucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polymucleotides and their gene products are used as genetic or blochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and antibodies against them can be used in pharmaccutical compositions to treat the cancers and proliferative disorders such as neoplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mammalian cell and detecting cancer, particularly of the colon or prostate, comprises 3351 human polynucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Klinger J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is one of 3351 sequences in a library of human polymucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polymucleotides. The probes can be used for chromosome mapping of the polymucleotides. The probes can be generated. The polymucleotides and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polymucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carringenesis pathway and/or monitor the efficacy of therapies and preventions. The polymucleotides along the antibodies against them can be used in pharmaceutical compositions to treat the cancers and proliferative disorders such as neoplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     924

The present invention describes a library of human polynucleotides

comprising the sequences given in AAZ12532 to AAZ1779. Also described is

cancerous state of a mammalian cell, comprising detecting at least one

differentially expressed gene product in a test sample from a cell

cancerous state of a mammalian cell, comprising detecting at least one

differentially expressed gene product in a test sample from a cell

concerous state of a mammalian cell, comprising detecting at least one

differentially expressed gene product in a test sample from a cell

conserved of being cancerous, where the gene product is encoded by one of

the 5248 polymucleotide sequences given in AAZ12532 to AAZ17779. The

polymucleotides can be used as a source of primers and probes, which can

conserved for a variety of purpose, e.g. detection of expression levels,

mapping, tissue typing or profiling, forensics, genetic analysis and

detection of polymorphisms. Polypeptides encoded by the polymucleotides

concerved a seaf for raising antibodies for experimental, diagnostic and

therapeutic purposes. The polymucleotides may also be used to construct

arrays for diagnostics (which may be used to determine function of an

concerls (e.g. to identify abnormal or diseased tissue in a human, to

diagnosis, prognosis and management of colorectal cancer, breast cancer,

and lung cancer. The polymucleotides can also be used to screen for

peptide analogues and antagonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1004

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel isolated human polymucleotides obtained by screening for differential expression in colon cancer, breast cancer and lung acancer call lines. The polymucleotides of the invention are represented in AAX98275-X99118 and encode polypeptides of protein families selected from 4 transmembrane segments integral membrane callular activities (AAA), eukaryotic aspartyl proteases, GATA family of transmeription factors, G-protein apha subunit, phorbolesters or diacylglycerol binding proteins, protein kinase, protein phosphatase 2C, cranscription factors, G-protein apha subunit, mortaining proteins. The croaded polypeptides also have a functional domain selected from Ank repeat, basic region plus leucine zipper transcription factors, crepett, basic region plus leucine zipper transcription factors, crepett, basic region plus leucine zipper transcription factors, commodomain, EF-hand, SH3 domain, WD domain/G-beta repeats, zinc finger (CCHC class), and zinc-binding metalloprotease (C domain, The polymucleotides encode polypeptides with similarity to known protein families and are predicted to have similar properties. The novel copynucleotides can be used to develop products for use as therapeutic agents and in forensics, genetic analysis, mapping and diagnostic complications. In particular, the product can be used for treating e.g. cervical cancers, melanomas, colorectal adenocarcinomas, wilm's tumour, sarcomas, cretinolary encodermia, promyelocytic leukemia, monocytic leukemia, and lymphomas euch as histiocytic lymphoma, and management of cancers. They can be used for treating e.g. myeloid leukemia, and lymphomas euch as histiocytic lymphoma, and management of cancers in ung carcinomas, leukemias, and encodermal dysplasia, congenital alveolar dysplasia, and encodermal dysplasia, congenital alveolar dysplasia of the cervix, fibrous dysplasia, defended encodermal dysplasia, hyperplasias, e.g. endometrial, adrenal, breast, c.c. h.c. e.g. endometrial, adrenal, hyperplasias or pseudoepplemented or pay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antegonists of the polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. The present invention describes a library of human polymucleotides comprising the sequences given in AAZ12532 to AAZ1779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the productides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polymocleotides can be used for raising antibodies for experimental, diagnostic and detection of polymorphisms. Polypeptides encoded by the polymocleotides can be used for raising antibodies for experimental, diagnostic and construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two calls (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic purposes. The polymocleotides of the invention are especially used in the diagnosis, prognosis and management of colorects, cancer, and management of colorects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human genes and their expression products which are differentially expressed in different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Randazzo F, Kennedy GC, Pot D, Kassam A;

New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                                                                                                                                                                                                                                      The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is affilicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, ovarian cancer, identification; detection; characterisation; tumour; kinase; marker; cytostatic; antisense gene therapy; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy

                                                                                                                                                                                                                                                                                                  ö
                                                                          marker (1) (see AAF9854 to AAF98730), in a control non-ovarian cancer sample, mormal level of expression of (1) in a control non-ovarian cancer sample, where a significant difference between the level of expression in (a) and (b) is an indication that the patient is afflicted with ovarian cancer. (I) have cytostatic activities and can be used in antisense gene therapy. The method, compositions and kits from the present invention can be used for: (1) assessing and treating ovarian cancer; (2) making isolated hybridoma, which produces an antibody useful for ovarian cancer assessment; and (3) inhibiting ovarian cancer in a patient. AAF98573 to AAF98593 represent human kinase marker primers and probes which are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for
                                                    s present invention describes a method for assessing whether a patient afflicted with ovarian cancer by comparing: (1) the expression of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.
 comprises detecting changes in the expression of a variety of markers.
                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, leukocyte, gene expression profiling; allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, cytomegalovirus, infection, gene,
                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and polypeptides are also useful for isolating compounds with cytostatic polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                      New peptide useful as a marker for the diagnosis of breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ003152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, prostate cancer, cytostatic, carcinogen, pharmacodyanamic marker, pharmacogenomic marker, gene, 88.
                                                                                                                                                                                                                                                                                                                                                                                              New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.

                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                          The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; determining whether prostate cancer has metastasized in a patient; (l) assessing the aggressiveness or indolence of prostate cancer in a patient; (I) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                               Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides concerous) ovarian calls. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the conception ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient antisense oligonucleotide complementary to a marker of the patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer comparing the level of expression of a marker in a patient sample and a normal level of expression of the expression levels indicates ovarian cancer. The level of expression of a marker or a secreted protein or to a transcribed compared to responds to a secreted protein or to a transcribed compared to a secreted protein or to a transcribed compared to a secreted protein or to a transcribed compared to a secreted protein or protein or protein fragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed compared by detecting the marker, under stringent conditions. The polynucleotide ownics with the marker or anneals with a portion of the polynucleotide which anneals with the marker or anneals with a patient compared or expression of the marker is also used for monitoring the presence of a transcribed comparising the marker or anneals with a patient or sample at a first point in time, repeating the marker or a subsequent contained and comparing the level of expression. He marker is a subsequent of expression of the marker is a pared to be a second or a pared to be a second or a pared or a p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     using an ovarian Lissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the
Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.

                                                                                                                                                                                                   The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether progression of prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer and many determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                              Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                               assessing the aggressiveness or indolence of prostate cancer in a pat i (I) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. noncancerus) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the concernus) ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer comparing the level of expression of the invention. The markers and a normal level of expression of the marker in a patient sample and a normal level of expression of the expression levels indicates ovarian cancer. The level of expression of a marker ordersponds to a secreted protein or to a transcribed comparing to the marker. The presence of protein or protein cransponding to the marker. The presence of protein or protein cransponding to the marker. The presence of expression of the marker is assessed by detecting the presence in the sample, a protein or protein cransponding to the marker. The presence of a transcribed comparising to the marker, under stringent conditions. The polynucleotide which anneals with the presence of a transcribed colynucleotide which anneals with the presence of a transcribed colynucleotide which anneals with the presence of a transcribed colynucleotide which anneals with the presence of a transcribed comparising the marker, under stringent conditions. The marker is also used for monitoring the presence of a transcribed column or protein the intent propersion of the marker in a protein or protein of expression of the marker in a patient which involves detecting expression of the marker in a patient which involves detecting expression of the marker in a patient which involves detecting expression. The marker in a patient of expression of the marker in a practical marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid markers which are overaxpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancercus) ovarian cells. The invention also relates to polypeptides cancercus) ovarian cancer intibodies that selectively bind to the canceded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient an antisense oligonuclecide complementary to a marker of the invention. The markers are useful for assessing it a patient is afflicted with ovarian cancer sample. A difference between the amarker in a patient sample and a normal level of expression of a marker ortresponds to a secreted protein or to a transcribed of expression of the marker corresponds to a secreted protein or to a transcribed polynucleotide or its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the marker or anneals with a portion of the polynucleotide which anneals with the marker or anneals with a portion of the polynucleotide comprising the marker or anneals with a portion of the polynucleotide which anneals with the marker or anneals with a specient or protein time, repeating the marker in a patient sample at a first point in time, repeating the method is carried out time and comparing the level of expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression of the marker of the printed or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer presence of the printed specification, but was obtain

The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (d) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity (c) (a); or (f) degenerate variants of (a). Polypeptides (ABP68595-C) ABP68637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polynucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and probes or primers for nucleic acid hybridisation, in the design and compositions and proteins in the tumour colls, in vaccines and for gene therapy. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated nucleic acid molecules (markers) overexpressed in ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acid markers which are overexpressed in

                                                                                                                                           New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                                                                                                                       The invention relates to novel genes (AAH68727-AAH73383) associated with occivical cancer with cytostatic activity. The nuclaic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient, and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated polynucleotide and pancreatic tumor polypeptides, useful idiagnosing, preventing and/or treating cancer, particularly pancreatic

cancerous) ovarian cells as compared to their expression in normal (i.e. noncarcerous) ovarian cells. The invention also relates to polypeptides cancerous) ovarian cells. The invention also relates to polypeptides corceded by the markers, antibodies that selectively bind to the cold developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer which involves comparing the level of expression of the invention. The marker are useful for assessing if a patient is afflicted with ovarian cancer which involves comparing the level of expression of the marker in a control non-ovarian cancer sample. A difference between the expression levels is didicates ovarian cancer and if expression of the marker corresponds to a secreted protein or to a transcribed of samessed by detecting the presence in the sample, a protein or protein fragment is detected using an antibody that specifically binds with the protein or protein creaments with a marker or anneals with a portion of the marker is assessed by detecting the marker or anneals with a portion of the polynucleotide comprising the marker or anneals with a portion of the polynucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of expression of the marker is also used for monitoring the progression of the marker in a satiant which in an antiport of the marker or anneals with a partion of the marker is also used for monitoring the progression of the marker in a partion of the marker in a pration of the marker in a partion of the marker in a pration of the marker in a partion of the marker in a protein or protein in a partion of the marker in a partion of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the invention. Note: The sequence data for this patent did not form part of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ention. Note: The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Breast specific; cancer staging; cancer imaging; breast cancer; non-cancerous disease states in breast tissue; gene therapy; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cafferkey R;

The invention describes a breast specific nucleic acid. The nucleic acids, polypeptides, antibodies, agonists and antagonists, and compositions comprising them are useful for identifying, diagnosing, monitoring, staging, imaging, and treating breast cancer and noncancerous disease states in breast tissue, in gene therapy, vaccine engineered breast tissue for treatment and research. The nucleic acids may be used as molecular markers for detecting breast cancer for accurate staging of the disease and monitoring the progress of cancer for accurate staging of the disease and monitoring the progress of cancer treatments, and as hybridisation probes or primers. This sequence encodes a breast specific protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (SI). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention. The activity of the polypeptide of the invention asy be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel method for monitoring differential expression of genes in a filamentous fungal cell. Specifically, it refers to identifying differential gene expression occurring between two related filamentous fungal cells and comprises adding detection reporter labeled nucleic acids of filamentous fungal cells to a substrate array of richoderma reses (Trichoderma reses) expressed sequenced tags (BSTS), or suppression subtractive hybridization (SSH) clones and detecting a signal in the array. The present invention further describes a computer readable medium having for monitoring differential expression of several genes in a first filamentous fungal cell relative to expression of the same genes in one or more second filamentous fungal cells. It also provides a search unit for comparing a target sequence to a T. resesi BST sequence of the data storage unit to identify homologous sequences, and a retrieval unit for obtaining the homologous sequence (s). Accordingly, it provides a method useful for identifying microbial genes induced when the discovering new genes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Note that this method utilizes an array where one spot equals or
                                                                                                                                                                                                ö
in records ACN78851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T_reesei suppressive subtractive hybridization (SSH) cDNA clone Seq 1051.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene
```

```
The invention relates to an isolated polymucleotide which encodes an immune related protein or a protein exhibiting biological properties of an immune-related protein with a sequence selected from 26 sequences. The expression vector and reagant are useful for the preparation of a capture such as allergic, autoimmune, inflammatory or infectious diseases, e.g. asthma, allergic, autoimmune, inflammatory or infectious diseases, e.g. asthma, allergic rhinitis, atopic dermatitis, hives, conjunctivitis, systemic lupus erythematosus, myasthenia gravis, psoriasis, sepsis, gout, or colitis. The polypeptides may also be used to identify compounds which may act as activators or inhibitors at the ciryme's active site, to raise specific antibodies which can block the cryme and effectively reduce its activity, as a bait protein in a two-hybrid or three-hybrid assay to identify other proteins which bind to or interact with the human immune-related protein and modulate its activity, and for immunisation of mammals. The polymucleotides of the invention can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
microarrays can be organized based on function of the gene products. This polynuclectide sequence is a T. reesei SSH cDNA clone that forms part of the substrate array of the invention. NOTE: The SeqIDB 1-1188 referring to T. reesei SSTB or SSH clones or their combinations are available in electronic form from the USPTO web site (http://seqdata.uspto.gov/sequence.html; Document ID:20050069934).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antiallergic, antiinflammatory; antiasthmatic; dermatological; ophthalmological; immunosuppressive; immune related; allergic ruinitis; autoimmune; inflammatory; infectious disease; asthma; allergic rhinitis; atopic dermatitis; hives; conjunctivitis; systemic lupus erythematosus; myasthenia gravis; psoriasis; espsis; gout; colitis; immunisation;

                the marker is assessed by detecting the presence of a transcribed polynucleotide which anneals with the marker or anneals with a portion of polynucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method at a subsequent using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated nucleic acid molecules (markers) overexpressed in ovarian

with ovarian cancer, which involves comparing the level of expression of marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a marker corresponds to a secreted protein or to a transcribed polynucleotide or its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment corresponding to the marker. The presence of protein or protein fragment or protein an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed polynucleotide comprising the marker or anneals with a portion of the polynucleotide comprising the marker or anneals with a portion of the polynucleotide comprising the marker, under stringent conditions. The patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the marker in a subsequent than a comparing the level of expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                         using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the

```

The invention relates to nucleic acid markers which are overexpressed in

```
cancerous) ovarian cells as compared to their expression in normal (i.e. non-
cancerous) ovarian cells. The invention also relates to polypeptides
canced by the markers, antibodies that selectively bind to the
corresponding to a marker of the invention and a method of treating a
corresponding to a marker of the invention and a method of treating a
corresponding to a marker of the invention and a method of treating a
corresponding to a marker of the invention and a method of treating a
corresponding to a marker of the invention and a method of treating a
corresponding to a marker of the invelves complementary to a marker of the
invention. The markers are useful for assessing if a patient is afflicted
with ovarian cancer, which involves comparing the level of expression of
commarker in a control non-ovarian cancer sample. A difference between the
corresponds to a secreted protein or to a transcribed
complement is detecting the presence in the sample, a protein or protein
corresponding to the marker. The presence of protein or protein
corresponding to the marker. The presence of protein or protein
corresponding to the marker. The presence of protein or protein
corresponding to the marker. The presence of stranscribed
corresponding to the marker. The presence of a transcribed
correction fragment is detected using an antibody that specifically binds with the
correction or protein fragment. Alternatively, the level of expression of
colynuclectide which anneals with the marker or anneals with a portion of
construction or protein fragment. The marker or anneals with a portion of
construction or protein fragment is detecting the marker or anneals with a portion of
colynuclectide which anneals with the marker or anneals with a portion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a human ovarian cancer DNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the concernation and the properties are those involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient antisense oligonuclectide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer comparing the level of expression of with ovarian cancer, which involves comparing the level of expression of marker in a patient sample and a normal level of expression of the expression levels indicates ovarian cancer. The level of expression of a marker or a secreted protein or to a transcribed complement or protein the presence in the sample, a protein or protein cancer fragment corresponding to the marker. The presence of protein or protein cancer fragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is a sasessed by detecting the presence of a transcribed comprised by detecting the presence of a transcribed compression or protein or protein fragment. Alternatively, the level of expression of the marker is a sasessed by detecting the presence of a transcribed polynucleotide which anneals with the marker, under stringent conditions. The marker, under stringent conditions. In a marker is a sasessed by detecting the presence of a transcribed compression of the marker is a sasessed by detecting the presence of a transcribed marker is a sasessed by detecting the presence of a transcribed marker is a sasessed by detecting the presence of a transcribed marker is a sasessed by detecting the presence of a transcribed contraction or protein detected using the propersory of the marker is a sasessed by detecting the presence of a transcr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inis sequence represents a human ovarian cancer DNA marker of the invention. Note: The sequence data for this patent did not form part of from WIPO at ftp.wipo.int/pub/published_pot_sequences.
                                                                                                       Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian of this sequence represents a human ovarian cancer DNA marker of the

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. nonceration cancerus) ovarian cells. The invention also relates to polypeptides cancerous) ovarian calls. The invention also relates to polypeptides cancerous) ovarian cancer intolving inhibiting expression of a gene corresponding ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to calls of the patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of a marker in a patient sample and a normal level of expression of the marker in a patient sample and a normal level of expression of the cappession levels indicates ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a carresponds to a secreted protein or to a transcribed polynucleotide or its portion. The level of expression of the marker is assessed by detecting the presence of the protein or protein fragment is detected using an antibody that specifically binds with the frome or protein fragment. Alternatively, the level of expression of the marker is as oused for manitoring the presence of a transcribed polynucleotide comprising the presence of a transcribed comprising the anneals with a portion of the marker is as oused for manitoring the presence of covarian cancer in a patient which involves detecting the presence of covarian cancer in a patient which involves detecting the presence of covarian cancer in a patient which involves detecting the presence of covarian cancer in a patient comprising the level of expression of the marker is also used for manitoring the marker is used to ormanial with the marker is used for manitoring the marker is used to ormanial with 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides cancerous) ovarian calcs. The invention also relates to polypeptides canced by the markers, antibodies that selectively bind to the college to developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient an antibense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer sample. A difference between the a marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer sample. A difference between the carriersponds to a secreted protein or to a transcribed polynucleotide or its portion. The level of expression of the marker corresponding to the marker. The presence of protein or protein fragment corresponding to the marker. The presence of protein or protein fragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the marker or anneals with a portion of the marker is assessed by detecting the marker or anneals with a portion of the polymucleotide comprising the marker or anneals with a portion of the polymucleotide which anneals with the marker or anneals with a portion of the polymucleotide which anneals with the marker or anneals with a subsequent the sample at a first point in time, repeating the method is carried out time and comparing the level of expression. The method is carried out sample at a first point in time, repeating the method is carried out the printed appearance represents a human ovarian cancer DNA marker of the printed appearance represents a human ovarian cancer in a print did
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                       Human; ovarian cancer; ds; tumour; cytostatic; DNA marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the printed specification, but was obtained in electro
from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides cancerous) ovarian calcs. The invention also relates to polypeptides canced by the markers, antibodies that selectively bind to the canced by the markers antibodies that selectively bind to the patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient an antisense oligonuclecide complementary to a marker of the invention. The markers are useful for assessing the level of expression of the amarker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer sample. A difference between the carriersponds to a secreted protein or to a transcribed of polynuclectide or its portion. The level of expression of the marker corresponding to the marker. The level of expression of the marker corresponding to the marker. The presence of protein or protein cragment corresponding to the marker. The presence of protein or protein cragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the marker. The presence of a transcribed the marker is assessed by detecting the marker or anneals with a portion of the polymuclectide comprising the marker or anneals with a portion of the polymuclectide comprising the marker or anneals with a patient content which involves detecting the progression of the marker is also used for monitoring the progression of the marker is a patient sample at a first point in time, repeating the method is carried out time and comparing the level of expression. The marker is a patient sample at a first point in time, repeating the method of crast ovarian cancer. This sequence represents a human ovarian cancer plant of the printed specifi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                          Human; ovarian cancer; ds; tumour; cytostatic; DNA marker.

The invention also relates to polypeptides cancerous) ovarian cancer antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of a marker in a patient sample and a normal level of expression of the marker in a patient sample and a normal level of expression of a marker in a patient sample and a normal level of expression of a marker or separation of a secreted protein or to a transcribed carresponds to a secreted protein or a transcribed corresponding to the marker. The presence of protein or protein fragment is detected using an antibody that sample, a protein or protein fragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed the marker is assessed by detecting the presence of a transcribed the marker is assessed by detecting the presence of a transcribed the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed or the marker is an antibody that specifically binds with the protein or protein and the marker is a passessed by detecting the presence of a transcribed or the marker is an antibody the presenc

```
the polynucleotide which anneals with the marker or anneals with a portion of the polynucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypoptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-acacerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient affilicted with ovarian cancer comprishing providing to cells of the patient an antiense oligonuclectide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of a marker in a patient sample and a normal level of expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

expression levels indicates ovarian cancer. The level of expression of a marker corresponds to a secreted protein or to a transcribed marker corresponds to a secreted protein or to a transcribed polynucleotide or its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment corresponding to the marker. The presence of protein or protein cragment corresponding to the marker. The presence of protein or protein cragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed to polynucleotide which anneals with the marker or anneals with a portion of the polynucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient cample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, the properties or antibody of the invention is used to treat ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a human ovarian cancer DNA marker of the

concoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a patient sample and a normal level of expression of the carker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer. The level of expression of the capters of portion or protein cancer in a patient sample and a normal level of expression of the capters of polymucleotide or its portion. The level of expression of a sasessed by detecting the presence in the sample, a protein or protein fragment corresponding to the marker. The presence of protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed or the polymucleotide which anneals with the marker or anneals with a portion of the polymucleotide which anneals with the marker or anneals with a portion of the polymucleotide which anneals with the marker or anneals with a portion of the polymucleotide which anneals with the marker, under stringent conditions. The patient which involves detecting expression of the marker in a patient of patient which involves detecting expression of the marker in a patient or sample at a first point in time, repeating the method at a subsequent cime and comparing the level of expression comparian cancer. Or using an ovarian tissue sample. A composition comprising a marker. The sequence data for this patent did not form part of the printed specification, where the printed specification, where the printed specification, where the printed specif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

covarian cancer cells as compared to their expression in normal (i.e. noncacous) ovarian cells. The invention also relates to polypeptides encoded by the marker, antibodies that selectively bind to the cenceded by the marker, antibodies that selectively bind to the cenced by the marker of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of the carrier corresponding to the level of expression of the capturelectide or its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment. Alternatively, the level of expression of the protein or protein fragment. Alternatively, the level of expression of the polynucleotide which anneals with the marker or anneals with a portion of the polynucleotide of or monitoring the presence of a transcribed out time and comparing the level of expression of the marker is a busequent to a patient which involves detecting the marker, under stringent conditions. The manker is and comparing the level of expression of the marker in a patient warment at a first point in time, repeating the method is carried out time and comparing the level of expression. The method is carried out time and comparing the level of expression comparising the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the printed appearance of the printed appearanc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ð
                                                                                                 ABQ563106 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins encoded by the ABQ60775 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoractive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of colon cancer in a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence of state of other type of cancer, in antisense therapy, to generate colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate corresponding gene resides, and in tissue profilling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and to screen for peptide analogues and antagonists

                                                                                                                                                                                                                                                                   ö
                                              New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                   cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a parealignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient, and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.
potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity
                                                                                                                                                                                                                                                   Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

(I) is useful for: (a) assessing whether progression of prostate cancer in b monitoring the progression of prostate cancer in a patient; (b) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastisaized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                      Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; 88.
                                                                                                                                                                                                                                                                                                                                                                 Novel isolated nucleic acid molecule associated with cancerous state of
                                                                                                                                                                                                                                                                                                                                                                           prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer, stage of prostate cancer.

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian calls. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the cancerous) ovarian cancer involving inhibiting expression of a gene or of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer involving inhibiting expression of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer. The level of expression of a marker or sepaponds to a secreted protein or to a transcribed polynucleotide or its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment. Alternatively, the level of expression of the protein or protein fragment. Alternatively, the level of expression of the protein or protein fragment. Alternatively, the level of expression of the protein fragment. Alternatively, the level of expression of the protein fragment is assessed by detecting the marker or anneals with a portion of the polynucleotide which anneals with the marker or anneals with a patient sample at a first point in time, repeating the marker in a patient sample at a first point in time, repeating the method at a subsequent using an ovarian tissue sample. A composition comprising a marker or in a patient which involves detecting the presence of the marker or a patient which involves detecting the encode of the marker or anneals with a polynerial comparing the encode of the marker or anneals with a patient which involves detecting the comparing the marker or anneals with a patient sample at a first point in time, repeating the marker or a 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. noncancerus) ovarian calls. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the encoded by the markers, antibodies that selectively bind to the encoded by the markers intribodies that selectively bind to the corresponding to a marker of the invention and a method of inhibiting ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient antisense oligonucleotide complementary to a marker of the patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer. The level of expression of a separession levels indicates ovarian cancer ample. A difference between the corresponding to the marker. The presence of protein or protein cancer in a sessessed by detecting the presence in the sample, a protein or protein cancer in a sessessed by detecting the presence of a transcribed comparing to the marker. The presence of a transcribed complexed by detecting the marker or anneals with the marker is also used for monitoring the presence of the marker in a patient contained and comparing the method at subsequent contained out the marker is also used for monitoring the method at subsequent contained out the marker is an encoded of the marker of the marker is also used for monitoring the method at subsequent contained by the propersion of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           er cells as compared to their normal non-cancerous ovarian cells are to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated nucleic acid molecules (markers) overexpressed in ovarian

```
The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer comparing the level of expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a marker corresponds to a secreted protein or to a transcribed polynucleotide or its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment corresponding to the marker. The presence of protein or protein fragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed polynucleotide which anneals with the marker or anneals with a portion of the polynucleotide comprising the marker, under stringent conditions. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.

The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer involving inhibiting expression of a gene orresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer semple of expression of amarker in a patient sample and a normal level of expression of marker in a patient sample and a normal level of expression of the expression levels indicates ovarian cancer. The level of expression of a
marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.

consider corresponds to a secreted protein or to a transcribed polymucleotide or its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment corresponding to the marker. The presence of protein or protein fragment. Alternatively, the level of expression of protein or protein fragment. Alternatively, the level of expression of merker is assessed by detecting the presence of a transcribed polymucleotide which anneals with the marker or anneals with a portion of the polymucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of ovarian cancer in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the

progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer comparing the level of expression of a marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                             .

marker corresponds to a secreted protein or to a transcribed

polynucleotide or its portion. The level of expression of the marker is

sasessed by detecting the presence in the sample, a protein or protein

fragment corresponding to the marker. The presence of protein or protein

fragment corresponding to the marker. The presence of protein or protein

fragment is detected using an antibody that specifically binds with the

critical or protein fragment. Alternatively, the level of expression of

the marker is assessed by detecting the presence of a transcribed

condition or protein fragment. Alternatively, the level of expression of

the marker is assessed by detecting the presence of a transcribed

conditions. The

conditions of a transcribed portion of

conditions or patient which involves detecting the marker of varian cancer in a

condition of patient which involves detecting expression of the marker in a patient

condition of the level of expression. The method is carried out

cuing an ovarian tissue sample. A composition comprising a marker.

condition or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

conditions or antibody of the invention is used to treat ovarian cancer.

corcoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient antisense oligonuclecide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer. The level of expression of a marker orresponds to a secreted protein or to a transcribed polynuclectide or its portion. The level of expression of a secreted protein or to a transcribed polynuclectide or its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is a sasessed by detecting the presence of a transcribed polynuclectide which anneals with the marker or anneals with a portion of the polynuclectide which anneals with the marker or anneals with a portion of the polynuclectide comprisain the marker or anneals with a portion of the polynuclectide which anneals with the marker in a patient sample at a first point in time, respecting the marker in a subsequent cancer in a service and comparing the level of expression. The marker is a subsequent cancer in a patient sample at a first point in time, respecting the marker or anneals of the marker or in a patient cancer in a subsequent cancer in a cancer in a 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              °;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1.4%; Score 24; DB 5; Length 391;

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the concernation ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient an antisense oligonuclectide complementary to a marker of the patient an antisense oligonuclectide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of with ovarian cancer, which involves comparing the level of expression of the marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a sested by detecting the presence in the sample, a protein or protein cancer is detected using an antibody that specifically binds with the protein or protein fragment is detected using an antibody that specifically binds with the protein or protein fragment is assessed by detecting the presence of a transcribed comprising the presence of a transcribed comprising the presence of a transcribed comprising the presence of a variant contein of the marker is assessed by detecting the presence of a variant contein of the marker is an antibody that specifically binds with the marker in a marker in a portion of the marker is a sessed by detecting the presence of a variant contein or protein or protein fragment is also most of a marker or anneals with the marker in a marker in a serial or protein or protein or protein defined comprising the progression of continuous cancer in a marker is a serial or protein defined or such a protein or protein or pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out time and comparing the sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the
                                              Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are
                                                                                                     used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the concerous) ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a corresponding to a marker of the invention and a method of treating a the patient antibense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a patient sample and a normal level of expression of the expression never in a control non-ovarian cancer. The level of expression of a marker in a control non-ovarian cancer. The level of expression of a marker corresponds to a secreted protein or to a transcribed cor its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is a sessessed by detecting the presence of protein or protein corresponding to the marker. The presence of protein or protein fragment. Alternatively, the level of expression of the marker is a sessessed by detecting the presence of protein or protein or protein corresponding to the marker. The presence of protein or protein corresponding to the marker. The presence of protein or protein o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polymucleotide which anneals with the marker or anneals with a portion of the polymucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method at subsequent using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a human ovarian cancer DNA marker of the monthly invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                   Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1.4%; Score 24; DB 5; Length 391;

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancercous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer comparing the level of expression of a marker in a patient sample and a normal level of expression of the invention. The marker in a patient sample and a normal level of expression of a marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer. The level of expression of a marker ortesponds to a secreted protein or a transcribed polymucleotide or its portion. The level of expression of the marker is assessed by detecting the presence in the sample, a protein or protein fragment. Alternatively, the level of expression of the protein or protein fragment. Alternatively, the level of expression of the polymucleotide which anneals with the marker or a marker is also used for monitoring the presence of a transcribed polymucleotide which anneals with the marker or anneals with a portion of the polymucleotide comprising the marker, under stringent conditions. The sample at a first point in time, repeating the method as a subsequent using an ovarian tissue sample. A composition comprising a marker or anneals with a sequence represent or the method is carried out using an ovarian tissue sample. A composition comprising a marker of the invention is used to transcribed or antibody of the invention is used to transcribed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gape

```
The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specificaction or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (f) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, prostate cancer, cytostatic, carcinogen, pharmacodyanamic marker, pharmacogenomic marker; gene, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 404 BP; 130 A; 76 C; 42 G; 153 T; 0 U; 3 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (MILL-) MILLENNIUM PREDICTIVE MEDICINE INC.
